Paper Title

SAFER-Smart Alert and Fast Emergency Response Portal

Abstract

Disaster response systems are essential in reducing the impacts of natural disasters, but the majority of current platforms are not capable of offering real-time data availability, user interface, and support for integration with emergency services. The SAFER Portal aims to overcome the said limitations by offering real-time disaster alerts, emergency resources, and interactive user engagement features. This site offers live updates on earthquakes, cyclones, floods, droughts, landslides, and fires, blending live feeds from authoritative sources. It offers an emergency contact list, a chatbot, and a feedback system to encourage community participation. Unlike traditional disaster websites, this platform is cell phone- friendly, multi-lingual, and community media reporting. Its key features are automated data harvesting, integration with emergency services, and modular design for compatibility with AI for future advancements. In remedying problems of delayed updates, usability, and public disengagement, the project aims to develop a better, participative, and responsive disaster management system for improving public safety and readiness.
